Sequence 21, Application US/08963825

Patent No. 6110689

GENERAL INFORMATION:

APPLICANT: Qvist, Per

APPLICANT: Qvist, Per

APPLICANT: Bonde, Martin

TITLE OF INVENTION: A Method for Assaying Collagen Fragments

TITLE OF INVENTION: A Method and Use of the Method to Diagnose the Presence of TITLE OF INVENTION: Disorders Associated with the Metabolism of TITLE OF INVENTION: Disorders Associated with the Metabolism of TITLE OF INVENTION: Disorders Associated with the Metabolism of STRESPONDENCE ADDRESS:

ADDRESSEE: Darby & Darby PC

STREET: 805 Third Avenue

STREET: New York

STATE: New York

COUNTRY: USA

Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA 7:347-354(1988).
-!- FUNCTION: Collagen type III occurs in most soft connective tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            along with type I collagen.
-!- SUBUNIT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.
-!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

-!- PATHWAY: Methanogenesis; first step.
-!- SUBUNIT: THIS ENZYME IS COMPOSED OF SEVEN SUBUNITS FWDF (65 kDa),
-!- SUBUNIT: THIS ENZYME (31 kDa), FWDD (15 kDa), FWDE, FWDF, AND FWDG
                  -!- PATHWAY: Methanogenesis; first step.
-!- SUBUNIT: THIS ENZYME IS COMPOSED OF SEVEN SUBUNITS FWDA (65 kDa),
FWDB (53 kDa), FWDC (31 kDa), FWDD (15 kDa), FWDE, FWDF, AND FWDG-
-!- INDUCTION: By growth on tungsten or molybdenum under anaerobic conditions.
-!- SIMILARITY: Belongs to the fwdC/fmdC family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CATALYTIC ACTIVITY: Formylmethanofuran + H(2)O + acceptor = CO(2) + methanofuran + reduced acceptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-96163477; PubMed-8575452;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -I- FUNCTION: This is a receptor for interleukin-9.
-!- SUBCELLULAR LOCATION: Type I membrane protein and secreted.
-!- SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mus musculus (Mouse).

Kalyavava E., Mindlin S.;
Submitted (DEC-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Resistance to Hg(2+) in bacteria appears to be governed by a specialized system which includes mercuric reductase. Meraprotein is responsible for volatilizing mercury as Hg(0).
-!- CATALYTIC ACTIVITY: Hg + NADP(+) + H(+) = Hg(2+) + NADPH.
-!- CATALYTIC ACTIVITY: Hg + NADP(+) + H(+) = Hg(2+) + NADPH.
-!- COFACTOR: Binds I FAD per subunit (By similarity).
-!- SIMINITY: Helongs to class is a redox-active disulfide bond.
-!- SIMILARITY: Belongs to class I pyridine nucleotide-disulfide

"Overexpression of a Streptomyces viridochromogenes gene (glnII)
encoding a glutamine synthetase similar to those of eucaryotes confers resistance against the antibiotic phosphinothricyl-alanyl-alanine.";
J. Bacteriol. 172:5326-5334(1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
FUNCTION: This protein binds directly to 26S ribosomal RNA (By
                similarity).
-!- MISCELLANEOUS: There are two genes for L12 in S.pombe.
-!- SIMILARITY: Belongs to the L11P family of riboscomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptomyces viridochromogenes.

Assay for detecting cross-linked telopeptide analytes indicative of type II collagen resorption in vivo in a body fluid sample, comprises contacting the sample with an antibody which binds to the analyte.

Disclosure, Page 15; 34pp; English.

The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen (cartilage) resorption in vivo, for distinguishing between resorption of

                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to immunoassays for measuring type II collagen (cartilage) resorption in vivo. The method of analysing a body fluid sample for the presence of an analyte indicative of a physiological condition, involves contacting the body fluid sample with an antibody (Ab) which binds to the analyte, detecting binding of Ab in the body fluid sample, and correlating any detected binding to the physiological condition. The analysis is useful for measuring type II collagen non-mineralized and mineralized cartilage, and for measuring total cartilage resorption in vivo. The present sequence represents a linear synthetic peptide based on the carboxy-terminal telopeptide sequence of

The invention relates to a method of determining the rate of biosynthesis or breakdown of at least one inaccessible biological molecule in a confice the method is useful for diagnosis or monitoring and treatment subject. The method is useful for diagnosis or monitoring and treatment of diseases associated with an altered rate of biosynthesis/breakdown of of diseases associated with an altered rate of biosynthesis/breakdown of confice allowed the subject of the second treatment of the second treatment of the second treatment of the second treatment of diseases allowed the method is callowed; muscular dystrophy; athletic diabetes mellitus; muscle-wasting syndromes; muscular dystrophy; athletic constraining and cancer. The method is also useful for screening candidate training and cancer. The method is also useful for screening candidate creating mechanism studies and determining the risk of developing the dirugs, drug mechanism studies and determining the risk of developing the disease. The present sequence is human C-terminal telopeptide alpha 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining rate of biosynthesis or breakdown of inaccessible biological molecules, useful e.g. for diagnosis or monitoring treatment, by administering labeled precursor.

The invention relates to a method of determining the rate of biosynthesis or breakdown of at least one inaccessible biological molecule in a because the subject. The method is useful for diagnosis or monitoring and treatment of diseases associated with an altered rate of biosynthesis/breakdown of an isotopically labelled precursor molecule, specifically osteoporosis; left-ventricular hypertrophy; liver cirrhosis or fibrosis, congestive theoret failure; soleroderma; coal-miner's pneumoconiosis; cardiac or lung fibrosis; Alzheimer's disease; multiple sclerosis; rheumatoid arthritis; craining and cancer. The method is also useful for screening candidate gene or protein targets, phenotypic/human validation studies on potential cycles. The present sequence is human collagen type I cross-linked carboxy terminal peptide (ICTP). This sequence is used to illustrate the

Procollagen-III-C-terminal propeptide.

Diseases such as alcoholic cirrhosis, biliary cirrhosis, hepatitis, cardiac fibrosis, Crohn's disease, diabetic nephropathy constitutions caused by anyery result from an inappropriate production of and fibroses caused by anyery result from an inappropriate production of collagen fibrils. Collagen III is synthesised as a preproprotein which is fibrils are generated by cleavage of a propeptide from the C-terminus of individed by cleavage of a propeptide from the C-terminus collagen III clerminus. This sequence fibrils are formed, the PIIICP propeptide is released into the surrounding tissue fluids. The interpretate collages in immunoassay to chers which result from inappropriate collages the above diseases and chermine PIIICP concentrations and thus diagnose the above diseases and chermine PIIICP concentrations and thus diagnose the above diseases and chermine which cleases may show different levels of PIIICP in the serum so the fibrotic diseases may show different levels of PIIICP in the serum so the patient is suffering from. The new immunoassay may also be used to determine which disease a particular measure the rate of collagen synthesis in patients being treated with immunoal stochemical staining of cryostat and parifin sections to assess collagen synthesis in tissue samples from patients suspected of having fibrotic disease. New immunoassay for procollagen-III-C-terminal propeptide (PIIICP) useful for diagnosing diseases such as alcoholic cirrhosis, hepatitis and Schroeder W; Neumann R, Disclosure, Fig 1; 28pp; English Duchenne's muscular dystrophy. Burchardt ER, Kroll W, WPI; 1999-256748/22. N-PSDB; AAX57501

                                                                                                                                                                                                                       31-JAN-2000;
                                                                                                                                                    02-AUG-2001
                The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then by selecting a past 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins. Also included are a polymorphide in the adipocyte cells, a polymorphide in the adipocyte cells, a polymorphide so f the complex, selecting a modulating compound in adipocyte comprising any of the first and adipocyte cells, a SID (RTM) polymorphide comprising any of the 738 amino acid cells, a SID (RTM) polymorlectide comprising any of the 738 mucleotide sequences given in the specification (including its fragment or variant), a SID (RTM) polymorlectide comprising any of the 738 mucleotide sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the polymorlectides and a recondinant host cell comprising the vector, a protein chip comprising the polymorlectides and compounds are useful for record complex, polymorphides, polymorphides much as obesity or diabetes. The polymucleotides are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is probes or primers. The complex is protein interacting domains (SID (RTM)) for screening drugs that medulate the protein interaction, thus complexing the therapeutic effect. The present sequence represents a SID (prey) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                           New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences concloding them. The erzyme polypeptides of the invention may comprise the functional classes of oxidoraclusces, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), contributed hyperproliferative disorders (e.g. asthma), contributed and disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), contributed and disorders (e.g. and sorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. the encophilia), reproductive disorders (e.g. infertility) and confertious disorders (e.g. Influenza). The polymucleotides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences.
                                                                                                                                                                                                                    Novel polypeptides and polynucleotides useful for diagnosing, preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ovarian antigen; ovary disorder; breast disorder; neoplastic disorder; cancer; infectious disease; inflammatory disease; reproductive system disorder; autoimmume disorder; Alzheimer's disease; blood-related disorder; hyperproliferative disorder; hair loss; urinary system disorder; cardiovascular disorder; arthythmia; respiratory disorder; musculoskeletal system disorder; indocrine disorder; neurolity disorder; neurological disorder; endocrine disorder; gastrointestinal disorder; neurolity disorder; artifer disorder; pancreatic disorder; gastrointestinal disorder; sancreatic disorder; inherited disorder; avelopmental disorder; inherited disorder; askin aging; food additive;
                                                                                                                                                                                                                                           treating meural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to isolated ovarian related polypeptide (ovarian antigen) comprising a sequence at least 90% identical to a sequence antigen) comprising a sequence at least 90% identical to a sequence control of a sequence (51) appearing as ABG6029-ABG60296 having protein of a sequence (51) appearing as ABG6029-ABG60296 having protein of protein of a sequence (51) appearing as ABG6023-ABG60296 having protein of protein of sequence (51) appearing a medical condition in mammalian subject of 51. Also included are the cDNA are useful for diagnosing, preventing, an anti-S1 antibody and the cDNA are useful for diagnosing, preventing, an anti-S1 antibody and the cDNA are useful for diagnosing, preventing, cappedially diseases and/or disorders of the ovary and/or breast such as ovariant Krukenberg thmour and cancel), infectious diseases (systemic lupus erythematosus, rheumatory diseases) cattoinmund disorders (systemic lupus erythematosus, rheumatory diseases) autoinmund disorders (systemic lupus erythematosus, rheumatorid arthritis), blood-related disorders (sickle cell anaemia), arthritis), blood-related disorders (sickle cell anaemia), arthritis), blood-related disorders (sickle cell anaemia), arthritis), cardiovascular disorders (shilary system disorders (arthritimias), respiratory disorders), and sorders (alsorders (alsorders (alsorders (alsorders (alsorders (alsorders (alsorders (alsorders (alsorders))), liver disorders (bilary) liver citrinois), captorders, disorders (bilary), and chonders and and inherited disorders (bilary) liver citrinois to prevent skin adjing, for preventing hair loss, to maintain organs and wound healing one for supporting cell culture of primary tissues, compliate mammalian characteristics such as body height, to modulate mammalian metabolism, to change a mammal's mental or physical state, and covarian antigen, si protein of the invention or proservative. The present sequence data for this patent did ont form part of the printed sepecification, but was contained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated human ovarian related polypeptide useful for diagnosis/treatment of disorders of ovary and breast such as neoplastic disorders, infectious diseases, inflammatory diseases, and reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 11; SEQ ID NO 78; 524pp; English

Human adipocyte Selected Interacting domain, SID, #366.

```
polymucleotide encoding a polypeptide in the adipocyte cells, a recombinant host cell expressing at least one of the interacting recombinant host cell expressing at least one of the interacting computed in adipocyte cells, a SID (RTW) polymeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a SID (RTW) polymucleotide comprising any of the 738 nucleotide sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the polymeptides and a recomblex, polymeptides, polymucleotides and compounds are useful for record comprising the vector, a protein chip comprising the polymeptides and a recomblex, polymeptides, polymucleotides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID particularly useful for identifying selected interacting domains (SID exhibiting the therapeutic effect. The present sequence represents a SID (RTW) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.

This sequence represents a chimeric procollagen molecule of the invention. This sequence has the procollagen C-prepropeptide from the procollagen C-prepropeptide from the procollagen C-prapropeptide from the assembly of the monomer chains into propeptide is implicated in the assembly of the monomer chains into propeptide is implicated in the assembly of the N- and C-propeptides and formation of collagen in fibril-forming pro-alpha chains. The C and formation of collagen in fibril-forming pro-alpha chains. The C they are attached. The molecule of the invention comprises a first moiety they are attached. The molecule of the invention comprises a first moiety they are attached. The bused for treatment or diagnosis in humans consult in the collagen alpha-chain or a non-collagen material. The which is an alien collagen alpha-chain or a non-collagen material. The convel collagen molecule can be used for treatment or diagnosis in humans con amimals, especially for the treatment of procollagen suicide, as an education to promote (chronic) wound healing or fibrotic diseases with reduced scarring or for use in photography, brewing, containing substitutions in the recognition site, may have significantly altered properties and characteristics, such as different binding containing or alpha-chain selection properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C-propeptide; recognition sequence; procollagen; monomer chain; therapy; trimerised pro-alpha chain; fibril; procollagen suicide; wound healing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel pro:collagen mol. - comprising pro:collagen C-pro:peptide attached to an alien collagen alpha-chain or non-collagen material, useful e.g.
                                   C-propeptide; recognition sequence; procollagen; monomer chain; therapy; trimerised pro-alpha chain; fibril; procollagen suicide; wound healing; fibrotic disease; human; chimeric protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This sequence represents a truncated procollagen pro-alphal(III) chain that can be used in the procollagen molecules of the invention. The C-Droperide is implicated in the assembly of the monomer chains into trimerised pro-alpha chains prior to cleavage of the N- and C-propeptides trimerised pro-alpha chains prior to cleavage of the N- and C-propeptides of propeptides determine the type-specific assembly of the moieties to which they are attached. The molecule of the invention comprises a first moiety which is an alien collagen alpha-chain or a non-collagen meterial. The convert is an alien collagen abba-chain or a non-collagen meterial. The convert collagen molecule can be used for treatment or diagnosis in humans can mimals, especially for the treatment of procollagen suicide, as an diseases with reduced scarring or for use in photography, brewing, containing substitutions in the recognition site, may have significantly intered properties and characteristies, such as different binding containing substitutions in the recognition site, may have significantly containing substitutions in the recognition site, may have significantly containing substitutions.
                                                                                                                                                                                                                                                                                                                                                                                                        Novel pro:collagen mol. - comprising pro:collagen C-pro:peptide attached to an alien collagen alpha-chain or non-collagen material, useful e.g. for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   kinetics or alpha-chain selection properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; Page 28-31; 69pp; English.

Novel protein (useful for identifying genetic disorders) #630.

novel gene; novel protein; tissue marker; molecular weight marker; chromosome marker; genetic disorder.

Unidentified

WO2003054152-A2.

```
The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gols; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ren F, Zhang J, Zhao QA, Wang J;

```

```
An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 68; Page 197-200; 331pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the tumours in an individual via the detection and measurement of the tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83102-ABA83109, ABA83180, CC ABA83181 and ABA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual cassessing the relative severity of ovarian cancer, in prognostic tests for a ssessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being particular tumour as The methods can additionally be used to identify a particular tumour solutionally be used to identify a particular tumour solutionally be used to identify a particular tumour selected from serous cystadenoma, borderline serous tumour, mucinous cystadenoma, borderline mucinous tumour, mucinous cystadenoma, endometriol carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, endometriol carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, cystadenofibroma, adenofibroma and Brenner cumour. The ovarian tumour marker genes of the invention were identified overexpressed in a broad variety of ovarian epithelial tumour cells overexpressed in a broad variety of ovarian epithelial tumour cells implicated in immune response pathways, in the regulation of cell in multiple and in protein folding, and many of these are membrane-conversed to the invention were secreted. In addition to their use as diagnostic and converse the converse of the invention and in protein folding, and many of their energy their energes of their energes or their encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker

The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90749, ABB907450 and ABB90756. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenic activity. They are useful for inhibiting tumour growth, necengligenesis in subjects bearing a vascularised tumour. prowth, necengligenesis in subjects retinopathy, rheumatoid arthritis and psoriasis Human, mouse and rat TEM retinopathy, rheumatoid arthritis and psoriasis Human, mouse and rat TEM are disclosed, as are marker oligonucleotide sequences: tumour are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL91996-ABL92041 and ABL92143-ABL92191; normal endothelial markers (NEM) ABL92042-ABL92074; and pan-endothelial markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20, Application US/08278774

Patent No. 6653450

GENERAL INFORMATION:
APPLICANT: Berg, Richard A
APPLICANT: Toman, David P
APPLICANT: Toman, David P
APPLICANT: Wallace, Donald
TITLE OF INVENTION: MUTATED RECOMBINANT COLLAGENS
NUMBER OF SEQUENCES: 33
CORRESPONDENCE ADDRESS:
ADDRESSER: COLLAGEN CORPORATION
STREET: 2500 Faber Place
CITY: Palo Alto
COUNTRY: USA
                                                                                         COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/548,608
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compartible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
APPLICATION NUMBER: US/08/278,774
FILING DATE: 22-UUL-1994
